Hillman & Walton Imp.

MYIAGRA LATIROSTRIS, *Gould.*

Broad-billed Flycatcher.

Myiagra latirostris, Gould in Proc. of Zool. Soc., Part VIII. p. 172.

I POSSESS two examples of this species, one of which was procured on the north coast by Mr. Dring, and the other at Port Essington by Mr. Gilbert. It is in every respect a true *Myiagra*, and is rendered remarkably conspicuous by the great breadth or lateral dilatation of the bill. As no notes accompanied the specimens, I am unable to give any particulars as to its habits and economy; in all probability they are very similar to those of the other members of the genus.

All the upper surface, wings and tail dark bluish gray, with a shining greenish lustre on the head and back of the neck; throat and chest sandy buff; under surface white; bill black; irides blackish brown; feet black.

The figures are of the natural size.
